

# TASK RECORD

NAME: VIKASINI.K

DEPARTMENT: B. Tech CSE (Artificial Intelligence and Data Science)

COLLEGE: Vels institute of science, Technology and Advance studies

INTERNSHIP ROLE: Data Analyst

TASK : HTML MY UNDERSTANDING FROM THE VIDEOS

1. What is HTML?

HTML stands for HyperText Markup Language. I understood that HTML is used to create the basic structure of a webpage.

A webpage can contain headings, paragraphs, images, links, tables and other contents. HTML tags are used to tell the browser what type of content each part contains.

Example:

```
<h1>My First Web Page</h1>
```

```
<p>Welcome to my webpage.</p>
```

Here, <h1> is used for the heading and <p> is used for the paragraph.

What I understood

I understood that HTML is the basic language used to create the structure of a webpage.

2. Simple HTML Example Walkthrough:

I learned that an HTML document has a basic structure. The main parts are html, head and body.

Example:

```
<!DOCTYPE html>

<html>

<head>

  <title>My First Page</title>

</head>

<body>

  <h1>My First Heading</h1>

  <p>My first paragraph.</p>

</body>

</html>
```

My Understanding

- <!DOCTYPE html> tells the browser that the document is HTML.
- <html> is the main element of the webpage.
- <head> contains information about the webpage.
- <title> gives the title shown in the browser tab.
- <body> contains the content displayed on the webpage.
- <h1> is used for a heading.
- <p> is used for a paragraph.

I understood that every HTML page should have a proper structure so that the browser can understand it correctly.

### 3. HTML Tags:

HTML uses tags to define different parts of a webpage.

Most tags have an opening tag and a closing tag.

Example:

`<p>This is my paragraph.</p>`

Here:

- `<p>` is the opening tag.
- This is my paragraph. is the content.
- `</p>` is the closing tag.

Some common HTML tags are:

HTML Tag Use:

`<h1>` = Heading

`<p>` = Paragraph

`<br>` = Line break

`<a>` = Link

`<img>` = Image

`<table>` = Table

My Understanding:

I understood that HTML tags help the browser understand what each piece of content is.

#### 4. How Web Browsers Work:

I understood that a web browser is used to display a webpage to the user.

When we open a webpage, the browser reads the HTML code and displays the result on the screen.

For example, if we write:

```
<h1>My First Heading</h1>
```

```
<p>My first paragraph.</p>
```

the browser will show the heading and paragraph instead of showing the tags as normal text.

My Understanding

I learned that the browser interprets the HTML code and converts it into the webpage that we see.

5. What are HTML Headings?

HTML provides different levels of headings from `<h1>` to `<h6>`.

```
<h1>Heading 1</h1>
```

```
<h2>Heading 2</h2>
```

```
<h3>Heading 3</h3>
```

```
<h4>Heading 4</h4>
```

```
<h5>Heading 5</h5>
```

```
<h6>Heading 6</h6>
```

`<h1>` is the main and largest heading by default, while `<h6>` is the smallest heading.

Heading Size:

The heading tags have different default sizes. We can also change their size using CSS.

Why headings are important:

Headings make the webpage easier to read. They help to divide the content into different sections.

My Understanding:

I understood that headings are not only used to make text bigger. They also help to organize the webpage content properly.

## 6. What are HTML Attributes?

From this video, I understood that attributes provide additional information about an HTML element.

Attributes are normally written inside the opening tag.

Example:

```
<a href="https://example.com">Visit Website</a>
```

Here, href is an attribute. It tells the browser where the link should go.

HTML href Attribute:

The href attribute is mainly used with the <a> tag to specify the destination of a link.

```
<a href="https://example.com">Click Here</a>
```

HTML Image Attributes:

Images can also have attributes.

```

```

Here:

- src specifies the image location.
- width specifies the width.
- height specifies the height.

The alt attribute can also be used to provide alternative text for an image.

```

```

### HTML Style Attribute:

The style attribute can be used to add styling directly to an HTML element.

```
<p style="color:blue;">This is a paragraph.</p>
```

Here, the paragraph text is given a blue color.

### HTML lang Attribute:

The lang attribute is used to specify the language of the HTML document.

```
<html lang="en">
```

Here, en represents English.

### My Understanding:

I understood that attributes give extra information or instructions to HTML elements. They are written inside the opening tag.

### 7. HTML Comments:

HTML comments are used to write notes inside the HTML code.

The browser does not display comments as webpage content.

How to write a comment:

```
<!-- This is a comment -->
```

We can also use comments to explain a part of our code.

Example:

```
<h1>My Website</h1>
```

```
<!-- This paragraph contains my introduction -->
```

```
<p>Hello, welcome to my website.</p>
```

The comment will not appear on the webpage.

Why we use comments:

I understood that we use these comments can help us what a particular part of the code is used for. They are also useful when the HTML code becomes longer.

My Understanding:

Comments are mainly for the person writing or reading the code. They are not displayed to the user on the webpage.

8. What are HTML Elements?

An HTML element generally consists of an opening tag, content and a closing tag.

Example:

```
<p>My first paragraph.</p>
```

The complete `<p>My first paragraph.</p>` is an HTML element.

Nested HTML Elements:

I learned that one HTML element can be placed inside another HTML element. This is called nesting.

Example:

```
<html>
```

```
<body>
```

```
  <h1>My First Heading</h1>
```

```
  <p>My first paragraph.</p>
```

```
</body>
```

```
</html>
```

Here, the `<body>` element is inside the `<html>` element.

## Remember to End HTML Elements:

When an element has an opening and closing tag, the closing tag should be written properly.

```
<p>Hello</p>
```

If the closing tag is missing, the browser may not display the content as expected.

## Empty HTML Elements:

Some HTML elements do not have any content or closing tag.

For example:

```
<br>
```

The `<br>` element is used to create a line break.

## HTML Tags are Not Case Sensitive:

I learned that HTML tags are not case sensitive.

For example:

```
<p>Hello</p>
```

and

```
<P>Hello</P>
```

can be understood as the same HTML tag.

But I understood that it is better to use lowercase letters because it makes the code easier to read and is the common practice.

## My Understanding:

I understood that HTML elements are the actual building blocks of a webpage. Elements can also be placed inside other elements.

## 9. What are HTML Paragraphs?

The `<p>` tag is used to create a paragraph in HTML.

Example:

```
<p>This is my first paragraph.</p>
```

```
<p>This is my second paragraph.</p>
```

Each `<p>` element creates a separate paragraph.

### Controlling Line Breaks

The `<br>` tag is used when we want to move the text to the next line.

Example:

```
<p>
```

```
Hello<br>
```

```
Welcome to my webpage.
```

```
</p>
```

The output will show:

Hello

Welcome to my webpage.

My Understanding:

I understood that the `<p>` tag is used for paragraphs and `<br>` is used when we need a line break inside the content.

## What I Learned from These Videos:

After watching these chapters, I understood the basic concepts of HTML.

I learned:

1. What HTML is and why it is used.
2. Basic structure of an HTML document.
3. How HTML tags work.
4. How a browser reads HTML code.
5. Different heading levels from `<h1>` to `<h6>`.
6. How attributes provide extra information.
7. How to use attributes like href, src, style and lang.
8. What HTML comments are and why they are used.
9. What HTML elements are.
10. What nested and empty elements mean.
11. How to create paragraphs.
12. How to use `<br>` for line breaks.

## Conclusion:

These videos helped me understand the basic structure of HTML. Before learning HTML, tags and elements were confusing to me. After going through the examples, I understood how HTML tags, elements and attributes are used to create a simple webpage. I can now understand a basic HTML code and how it is displayed in a browser.
